

Digital Forensic Investigation Report

Subject: Alleged Unauthorized Wireless Network Access / Hacking Activity

Prepared from forensic examination screenshots of disk image SCHARDT.dd

1. Case Overview

This report summarizes a forensic examination performed on a Windows XP computer disk image seized as evidence in an investigation into suspected unauthorized wireless network access ("wireless hacking"). The image was analyzed using standard digital forensic tools on a Kali Linux workstation to identify the computer's owner, user activity, and any tools or artifacts consistent with hacking.

Case Name	State/Agency v. Greg Schardt — "Hacking Case"
Student Name	Fuseini Imoru Kantuogaa
Student ID	17291
Evidence Item	Disk image SCHARDT.dd (8 segments: SCHARDT.001–.008), NTFS/exFAT, ~635 MB
Source of Evidence	NIST CFReDS public digital forensics reference image (hacking-dd dataset)
Suspect / Registered Owner	Greg Schardt
Alias Found on System	"Mr. Evil" (local Windows admin account)
Operating System	Microsoft Windows XP (Build 2600), install date 2004-08-19
Host / Computer Name	N-1A9ODN6ZXK4LQ, Workgroup: EVIL
Examiner Tools Used	Kali Linux, Sleuth Kit (mmls/fls/icat), RegRipper, evtparse.pl, tshark/Wireshark, rifiuti2, ClamAV

2. Chain of Custody / Evidence Handling

- Evidence acquired as 8 raw image segments (SCHARDT.001–SCHARDT.008) and combined into a single image, SCHARDT.dd.
- MD5 hash values were calculated for each segment and the combined image to verify integrity before analysis.

- The image was mounted read-only throughout the examination to preserve the original evidence.
- Partition table (mmls) confirmed a single NTFS/exFAT partition starting at sector 63.

3. Key Evidence Identified

3.1 Identity of the Computer's User

- Windows XP was registered to "Greg Schardt" (found in the SOFTWARE registry hive).
- A local administrator account named "Mr. Evil" was created on the machine and used 15 times, with the last login on 2004-08-27.
- The "Mr. Evil" account belonged to the local Administrators group (full system privileges).
- A network scanning tool (Look@LAN) was configured with owner "Greg Schardt" and LAN username "Mr. Evil" in the same settings file directly linking the two names to one person.
- Web/email history shows a Yahoo profile with first name "Greg", last name "Schardt", and account ID "mrevil2000".
- An email client (Forté Agent) profile was configured with the display name "Mr Evil" and address whoknowsme@sbcglobal.net.
- A second email alias, mrevilrulez@yahoo.com, appears repeatedly in cached web pages, confirming active use of that mailbox.

3.2 Hacking / Network-Intrusion Tools Found

- NetStumbler 0.4.0 — used to detect and map nearby wireless (Wi-Fi) networks ("wardriving").
- Cain & Abel v2.5 — password recovery / network traffic sniffing tool.
- Ethereal 0.10.6 with WinPcap 3.01 — network packet capture and analysis software.
- Look@LAN 2.50 — network scanning/mapping tool.
- Anonymizer Bar 2.0 — tool used to hide or mask a user's identity/location online.

- All of the above were installed, and later deleted, from the "Mr. Evil" desktop between 2004-08-20 and 2004-08-27 — the deleted installer files were recovered from the Windows Recycle Bin, confirming direct download and installation by this user.

3.3 Evidence of Actual Intercepted Network Traffic

- A file named "interception" stored in the Mr. Evil profile was found to be a genuine network packet capture (pcap) file, consistent with use of the Ethereal/WinPcap sniffing tools.
- Analysis of the capture showed intercepted web traffic from a separate, third-party handheld device (Windows CE/PocketPC), including logins to Microsoft/MSN and Passport authentication services indicating the suspect's software captured another person's network traffic, not just their own.

3.4 Wireless Hardware

- A Compaq WL110 Wireless LAN PC Card (Wi-Fi adapter) was installed on the system on 2004-08-27, matching the timeline of the wireless-scanning tool installations.
- System LAN IP address: 192.168.1.111; MAC address: 00:10:A4:93:3E:09.

3.5 Online Activity Consistent with Hacker Culture

- Outlook Express was subscribed to numerous hacking/cracking-themed newsgroups, including alt.2600.hackerz, alt.2600.crackz, alt.hacking, alt.binaries.hacking.computers, alt.binaries.hacking.utilities, and alt.dss.hack.
- mIRC (Internet Relay Chat) logs show participation in channels such as #Elite.Hackers, #evilfork, #ISO-WAREZ, #LuxShell, #ushells, and #mp3xserv channels commonly associated with hacking, warez (pirated software), and unauthorized shell access.
- Email addresses recovered from the profile include NOSPAM-fred@wardriving.com and hacked@2600.com, further reflecting an interest in wireless hacking ("wardriving") and hacker culture (2600 is a well-known hacker publication/community).

3.6 System Timeline

- Windows installed: 2004-08-19.

- "Mr. Evil" account created: 2004-08-19, 23:03:54 UTC.
- Hacking-related tools installed: 2004-08-20 through 2004-08-27.
- Wireless network card installed: 2004-08-27.
- System last shut down: 2004-08-27, 15:46:33 UTC.
- Time zone on system: U.S. Central Time.

4. Conclusion

The forensic evidence recovered from this disk image consistently and repeatedly links the registered owner, Greg Schardt, to the "Mr. Evil" user account and online alias. Multiple independent artifacts registry data, a network tool's configuration file, cached web pages, and an email client profile tie both names to the same person and the same machine.

The system contains a coordinated set of wireless-scanning, network-sniffing, and anonymizing tools, all installed and later deleted within the same one-week period, along with a wireless network adapter installed on the same day as several of these tools. A recovered packet-capture file shows that network traffic belonging to a separate, third-party device was actually intercepted, not merely that the software was installed.

Together, this evidence supports the conclusion that the "Mr. Evil" account on this computer, operated by Greg Schardt, was used to scan for and access wireless networks and intercept network traffic without authorization. This is a summary of technical findings only; determination of criminal intent or liability rests with investigators, prosecutors, and the court.
